# General Settings

Settings · https://wpemailmanager.com/docs/general-settings/

The plugin's General Settings can be accessed from **Email Manager > Settings** admin menu, or network admin menu, if the plugin is Network Activated in a multisite installation.

General Settings

## Host Provider Settings

Select your server management system and enter the relevant credentials. Without this, the plugin cannot function. The entered information is saved to wp-config.php file.

**NOTE:** If the wp-config.php file is not writable, you have to enter the constants manually. Learn how to do so here.

## Webmail Configuration

Enable this option if you would like to redirect users to a different webmail login page. This would be required if the user's emails and website are hosted on different servers.

## Integration Settings

### WP Ultimo

If you would like to offer your Websites as a Service powered by WP Ultimo the capability to create email accounts, **enable** this option.

Depending on the WP Ultimo version you are using, WP Email Manager will function differently as described in the following articles.

1. How to integrate & limit email accounts using WP Ultimo Version 1.X.
2. How to integrate & limit email accounts using WP Ultimo Version 2.X.

### Native Mapping

If you use WordPress' Multisite native domain mapping, enable this option to create email accounts for the mapped domains.

### Network Domain

If you would want users to create email accounts using the main site's domain name, **enable** this option. Please note that all users will view all the email accounts associated with the domain name.
