How to Generate a Domain’s DKIM Key

Developers · https://wpemailmanager.com/docs/how-to-generate-a-domains-dkim-key/

Use the following function, which works for CyberPanel, InterWorx, Mailcow, Mailu, Poste, Ploi, 20i/StackCP and WildDuck integrations only, to generate a domain's DKIM key and ensure that you are using WP Email Manager V 1.0.12+. Please note that this will only work if the domain does not have an existing DKIM key.

Function Usage

```
/**
 * Generate a DKIM Key
 */
$dkim_generated = wp_email_manager_generate_dkim_key('domain.com' );
if( $dkim_generated )
{
// Do Something
}
```
