# I Cannot Add Domains

Troubleshooting · https://wpemailmanager.com/docs/i-cannot-add-domains/

If when you try adding a domain via Domain Manager addon and get an error doing so, please ensure that your integration enables you to add domains.

If you are using aaPanel, please ensure that the domain (e.g. yourdomain.com) and its mail subdomain, i.e. mail.yourdomain.com, points to the server's IP.
